The Fine Spectra of the Cesàro Operator C 1 over the Sequence Space bvp, (1 ≤ p ∞)

Ali M. Akhmedov and Feyzi Basar

Abstract

The sequence space bvp consisting of all sequences (xk) such that (xk - xk-1) in the sequence space lp has recently been introduced by Basar and Altay [Ukrainian Math. J. 55(1)(2003), 136-147]: where 1 ≤ p ≤ ∞. In the present paper, the norm of the Cesàro operator C1 acting on the sequence space bvp has been found and the fine spectrum of the Cesàro operator C1 over the sequence space bvp has been determined, where 1 ≤ p < ∞.

KEYWORDS: Spectrum of an operator, Cesaro operator and the sequence space bvp
THE FINE SPECTRA OF THE CESÀRO OPERATOR $C_1$
OVER THE SEQUENCE SPACE $bv_p$, ($1 \leq p < \infty$)

ALI M. AKHMEDOV AND FYZI BAŞAR

Abstract. The sequence space $bv_p$ consisting of all sequences $(x_k)$ such that $(x_k - x_{k-1})$ in the sequence space $\ell_p$ has recently been introduced by Başar and Altay [Ukrainian Math. J. 55(1)(2003), 136–147]; where $1 \leq p \leq \infty$. In the present paper, the norm of the Cesàro operator $C_1$ acting on the sequence space $bv_p$ has been found and the fine spectrum of the Cesàro operator $C_1$ over the sequence space $bv_p$ has been determined, where $1 \leq p < \infty$.

1. Preliminaries, Background and Notation

Let $X$ and $Y$ be the Banach spaces and $T : X \to Y$ also be a bounded linear operator. By $R(T)$, we denote the range of $T$, i.e.,

$$R(T) = \{ y \in Y : y = Tx, \ x \in X \}.$$ 

By $B(X)$, we also denote the set of all bounded linear operators on $X$ into itself. If $X$ is any Banach space and $T \in B(X)$ then the adjoint $T^*$ of $T$ is a bounded linear operator on the dual $X^*$ of $X$ defined by $(T^* f)(x) = f(Tx)$ for all $f \in X^*$ and $x \in X$ with $\|T\| = \|T^*\|$. Also by $\text{Ker}(T)$, we denote the kernel of a bounded linear operator $T$.

Let $X \neq \{ \theta \}$ be a non trivial complex normed space and $T : \mathcal{D}(T) \to X$ a linear operator defined on a subspace $\mathcal{D}(T) \subseteq X$. We do not assume that $\mathcal{D}(T)$ is dense in $X$, or that $T$ has a closed graph $\{(x, Tx) : x \in D(T)\} \subseteq X \times X$. We mean by the expression "$T$ is invertible" that there exists a bounded linear operator $S : R(T) \to X$ for which $ST = I$ on $D(T)$ and $R(T) = X$; such that $S = T^{-1}$ is necessarily uniquely determined, and linear; the boundedness of $S$ means that $T$ must be bounded below, in the sense that there is $k > 0$ for which $\|Tx\| \geq k\|x\|$ for all $x \in D(T)$. Associated with each complex number $\alpha$ is the perturbed operator

$$T_\alpha = T - \alpha I,$$

Key words and phrases. Spectrum of an operator, Cesàro operator and the sequence space $bv_p$.

The authors wish to express their thanks to TÜBİTAK-BAYG for supplying the financial support by PC-B Programme during the preparation of the present work in winter 2004 and their common project.
defined on the same domain $D(T)$ as $T$. The spectrum $\sigma(T, X)$ consists of those $\alpha \in \mathbb{C}$ for which $T_\alpha$ is not invertible, and the resolvent is the mapping from the complement $\sigma(T, X)$ of the spectrum into the algebra of bounded linear operators on $X$ defined by $\alpha \mapsto T_\alpha^{-1}$.

The name resolvent is appropriate, since $T_\alpha^{-1}$ helps to solve the equation $T_\alpha x = y$. Thus, $x = T_\alpha^{-1}y$ provided $T_\alpha^{-1}$ exists. More important, the investigation of properties of $T_\alpha^{-1}$ will be basic for an understanding of the operator $T$ itself. Naturally, many properties of $T_\alpha$ and $T_\alpha^{-1}$ depend on $\alpha$, and spectral theory is concerned with those properties. For instance, we shall be interested in the set of all $\alpha$’s in the complex plane such that $T_\alpha^{-1}$ exists. Boundedness of $T_\alpha^{-1}$ is another property that will be essential. We shall also ask for what $\alpha$’s the domain of $T_\alpha^{-1}$ is dense in $X$, to name just a few aspects. For our investigation of $T, T_\alpha$ and $T_\alpha^{-1}$, we need some basic concepts in spectral theory which are given as follows (see [11, pp. 370-371]):

By a regular value $\alpha$ of a linear operator $T : D(T) \to X$ is meant a complex number such that:

- $T_\alpha^{-1}$ exists,
- $T_\alpha^{-1}$ is bounded,
- $T_\alpha^{-1}$ is defined on a set which is dense in $X$.

The resolvent set $\rho(T, X)$ of $T$ is the set of all regular values $\alpha$ of $T$. Its complement $\sigma(T, X) = \mathbb{C}\setminus\rho(T, X)$ in the complex plane $\mathbb{C}$ is called the spectrum of $T$. Furthermore, the spectrum $\sigma(T, X)$ is partitioned into the following three disjoint sets:

- The point (discrete) spectrum $\sigma_p(T, X)$ is the set such that $T_\alpha^{-1}$ does not exist. Any such $\alpha \in \sigma_p(T, X)$ is called an eigenvalue of $T$.
- The continuous spectrum $\sigma_c(T, X)$ is the set such that $T_\alpha^{-1}$ exists and satisfies (R3) but not (R2); that is $T_\alpha^{-1}$ is unbounded.
- The residual spectrum $\sigma_r(T, X)$ is the set such that $T_\alpha^{-1}$ exists (and may be bounded or not) but not satisfy (R3); that is the domain of $T_\alpha^{-1}$ is not dense in $X$.

To avoid trivial misunderstandings, let us say that some of the sets defined above may be empty. This is an existence problem which we are going to discuss. Indeed, it is well-known that in the finite dimensional case one has $\sigma_c(T, X) = \sigma_r(T, X) = \emptyset$ and the spectrum $\sigma(T, X)$ coincides with the set $\sigma_p(T, X)$.

By a sequence space, we understand a linear subspace of the space $w = \mathbb{C}^\mathbb{N}$ of all complex sequences which contains $\phi$, the set of all finitely non-zero sequences, where $\mathbb{N} = \{0, 1, 2, \ldots\}$. We write $\ell_\infty$, $c$ and $c_0$ for the sequence spaces of all bounded, convergent and null sequences, respectively. Also by $\ell_p$, we denote the spaces of all $p$-absolutely summable sequences, respectively; where $1 \leq p < \infty$. $bv$ is the space consisting of all sequences...
(\(x_k\)) such that \((x_k - x_{k+1})\) in \(\ell_1\) and \(bv_0\) is the intersection of the spaces \(bv\) and \(c_0\).

Let \(n, k \in \mathbb{N}\) and \(A = (a_{nk})\) be an infinite matrix of complex numbers \(a_{nk}\), and write

\[
(Ax)_n = \sum_k a_{nk}x_k, \quad (n \in \mathbb{N}, x \in D_{00}(A)),
\]

where \(D_{00}(A)\) denotes the subspace of \(w\) consisting of \(x \in w\) for which the sum on the right side of (1.1) exists as a finite sum. For simplicity in notation, here and in what follows, the summation without limits runs from \(0\) to \(\infty\). More generally if \(\mu\) is a normed sequence space, we can write \(D_\mu(A)\) for the \(x \in w\) for which the sum in (1.1) converges in the norm of \(\mu\). We shall write

\[
(\lambda : \mu) = \{A : \lambda \subseteq D_\mu(A)\}
\]

for the space of those matrices which send the whole of the sequence space \(\lambda\) into the sequence space \(\mu\) in this sense. A sequence \(x\) is said to be \(A\)-summable to \(\alpha\) if \(Ax\) converges to \(\alpha\) which is called as the \(A\)-limit of \(x\). We shall assume throughout unless stated otherwise that \(p, q > 1\) with \(p^{-1} + q^{-1} = 1\) and use the convention that any term with negative subscript is equal to naught.

We summarize the knowledge in the existing literature concerning with the spectrum and the fine spectrum of the linear operators defined by some particular limitation matrices over some sequence spaces. Wenger [18] examined the fine spectrum of the integer power of the Cesàro operator in \(c\). Reade [16] worked with the spectrum of the Cesàro operator in the sequence space \(c_0\). González [10] studied the fine spectrum of the Cesàro operator in the sequence space \(\ell_p\). Okutoyi [15] computed the spectrum of the Cesàro operator on the sequence space \(bv\). Recently, Yıldırım [19] worked with the fine spectrum of the Rhally operators acting on the sequence spaces \(c_0\) and \(c\). Lately, Coşkun [8] studied the spectrum and fine spectrum for \(p\)-Cesàro operator acting on the space \(c_0\). Akhmedov and Başar [1, 2] have recently determined, independently than that of González [10], the fine spectrum of the Cesàro operator in the sequence spaces \(c_0, \ell_\infty\) and \(\ell_p\), by the different way; respectively, where \(1 < p < \infty\). Quite recently, de Malafosse [14] and Altay and Başar [5] have respectively studied the spectrum and the fine spectrum of the difference operator on the sequence spaces \(s_r\) and \(c_0, c\); where \(s_r\) denotes the Banach space of all sequences \(x = (x_k)\) normed by

\[
\|x\|_{s_r} = \sup_{k \in \mathbb{N}} \frac{|x_k|}{r^k}, \quad (r > 0).
\]

Also, Akhmedov and Başar [3, 4], and Altay and Başar [6] have determined the fine spectrum with respect to Goldberg’s classification of the difference
operator $\Delta$ and the generalized difference operator $B(r, s)$ over the sequence spaces $\ell_p$, $bv_p$, and $c_0$, $c$, respectively.

In this work, our purpose is to find the norm of the Cesàro operator $C_1 \in B(bv_p)$ and to investigate the fine spectrum of the Cesàro operator $C_1$ on the sequence space $bv_p$ which is the natural continuation of Akhmedov and Başar [4], and Altay and Başar [5, 6].

2. The Space $bv_p$ of Sequences of $p$-bounded Variation

We wish to give some required knowledge about the sequence space $bv_p$. In [7], the sequence space $bv_p$ is defined by

$$bv_p = \left\{ x = (x_k) \in w : \sum_k |x_k - x_{k-1}|^p < \infty \right\}, \quad (1 \leq p < \infty).$$

It was proved that $bv_p$ is a $BK$-space which is linearly isomorphic to the space $\ell_p$ and the inclusion $bv_p \supset \ell_p$ strictly holds. The $\alpha$, $\beta$- and $\gamma$-duals of the space $bv_p$ are determined together with the fact that $bv_2$ is the only Hilbert space among the spaces $bv_p$. The continuous dual of the space $bv_p$ is determined and given by the following lemma which is needed in proving Theorem 3.2, below:

**Lemma 2.1.** [4, Theorem 2.3] Define the spaces $d_1$ and $d_q$ consisting of all sequences $a = (a_k)$ normed by

$$\|a\|_{d_1} = \sup_{k,n \in \mathbb{N}} \left| \sum_{j=k}^{n} a_j \right| < \infty$$

and

$$\|a\|_{d_q} = \left( \sum_k \left( \sum_{j=k}^{\infty} |a_j|^q \right)^{1/q} \right)^{1/q} < \infty, \quad (1 < q < \infty).$$

Then, $bv_1^*$ and $bv_p^*$ are isometrically isomorphic to $d_1$ and $d_q$, respectively.

The basis of the space $bv_p$ is also constructed and given by the following lemma:

**Lemma 2.2.** [7, Theorem 3.1] Define the sequence $b^{(k)} = \{b_n^{(k)}\}_{n \in \mathbb{N}}$ of the elements of the space $bv_p$ for every fixed $k \in \mathbb{N}$ by

$$b_n^{(k)} = \begin{cases} 0, & (n < k) \\ 1, & (n \geq k) \end{cases}.$$
Then the sequence \( \{b^{(k)}\}_{k \in \mathbb{N}} \) is a basis for the space \( bv_p \) and any \( x \in bv_p \) has a unique representation of the form
\[
x = \sum_{k} \lambda_k b^{(k)},
\]
where \( \lambda_k = x_k - x_{k-1} \) for all \( k \in \mathbb{N} \).

3. The Fine Spectra of the Cesàro Operator \( C_1 \) Over the Sequence Space \( bv_p \)

In this section, the fine spectra of the Cesàro operator \( C_1 \) over the sequence space \( bv_p \) has been examined. We shall begin with giving the basic result concerning with the norm of Cesàro operator \( C_1 \) on the space \( bv_p \).

The Cesàro operator \( C_1 \) is represented by the matrix
\[
C_1 = \begin{bmatrix}
1 & 0 & 0 & \cdots & 0 & \cdots \\
\frac{1}{2} & \frac{1}{2} & 0 & \cdots & 0 & \cdots \\
\frac{1}{3} & \frac{1}{3} & \frac{1}{3} & \cdots & 0 & \cdots \\
\vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\
\frac{1}{n+1} & \frac{1}{n+1} & \frac{1}{n+1} & \cdots & 1 & \cdots \\
\vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\
\end{bmatrix}.
\]

**Theorem 3.1.** \( C_1 \in B(bv_p) \) with the norm \( \|C_1\|_{(bv_p;bv_p)} = 1 \).

**Proof.** Since the linearity and the boundedness of the operator \( C_1 : bv_p \to bv_p \) is obvious, we omit the detail. Let us take any \( x = (x_k) \in bv_p \). Then, since one can observe that
\[
\frac{|x_0 + x_1 + \cdots + x_k|}{k+1} - \frac{|x_0 + x_1 + \cdots + x_{k-1}|}{k} = \frac{|(x_k - x_0) + (x_k - x_1) + \cdots + (x_k - x_{k-1})|}{k(k+1)}
\]
and the inequalities
\[
|x_k - x_0| \leq |x_k - x_{k-1}| + |x_{k-1} - x_{k-2}| + \cdots + |x_2 - x_1| + |x_1 - x_0|
|x_k - x_1| \leq |x_k - x_{k-1}| + |x_{k-1} - x_{k-2}| + \cdots + |x_2 - x_1|
\vdots
|x_k - x_{k-2}| \leq |x_k - x_{k-1}| + |x_{k-1} - x_{k-2}|
\]
hold we see by using the following known inequalities
\[
\left( \sum_{n=1}^{k} |a_n| \right)^p \leq k^{p-1} \sum_{n=1}^{k} |a_n|^p, \ (p \geq 1),
\]
and
\[
\frac{n^p}{(k+1)^p} \leq \frac{k}{k+1} ; \quad (1 \leq n \leq k , \quad p \geq 1)
\]
that
\[
\left| x_0 + x_1 + \cdots + x_k - \frac{x_0 + x_1 + \cdots + x_{k-1}}{k+1} \right|^p \\
\leq \frac{(k|x_k - x_{k-1}| + (k-1)|x_{k-1} - x_{k-2}| + \cdots + 2|x_2 - x_1| + |x_1 - x_0|)^p}{k^p(k+1)^p} \\
\leq \frac{k^{p-1}(k^p|x_k - x_{k-1}|^p + (k-1)^p|x_{k-1} - x_{k-2}|^p + \cdots + 2^p|x_2 - x_1|^p + |x_1 - x_0|^p)}{k^p(k+1)^p} \\
= \frac{k|x_k - x_{k-1}|^p + (k-1)|x_{k-1} - x_{k-2}|^p + \cdots + 2|x_2 - x_1|^p + |x_1 - x_0|^p}{k(k+1)^p} \\
\leq \frac{k|x_k - x_{k-1}|^p + (k-1)|x_{k-1} - x_{k-2}|^p + \cdots + 2|x_2 - x_1|^p + |x_1 - x_0|^p}{k(k+1)^p}.
\]

Now, we obtain by applying the Application 1 of Knopp [12, p. 143] that
\[
\|C_1x\|_{b^{p}_v}^p \leq \|x\|_{b^{p}_v}^p + \sum_{k=1}^{\infty} \frac{\sum_{j=1}^{k} j|x_j - x_{j-1}|^p}{k(k+1)} \\
= \sum_{k} |x_k - x_{k-1}|^p = \|x\|_{b^{p}_v}^p.
\]

So,
\[
\|C_1x\|_{b^{p}_v} \leq \|x\|_{b^{p}_v},
\]
which leads us to the consequence
\[
(3.1) \quad \|C_1\|_{(b^{p}_v,b^{p}_v)} \leq 1.
\]

Now, let us consider the element
\[
b^{(0)} = (1, 1, 1, \ldots).
\]

It is clear that
\[
C_1b^{(0)} = b^{(0)}
\]
and \(\|b^{(0)}\|_{b^{p}_v} = 1\). Hence,
\[
\|C_1\|_{(b^{p}_v,b^{p}_v)} \geq \|C_1b^{(0)}\|_{b^{p}_v} = \|b^{(0)}\|_{b^{p}_v} = 1,
\]
which yields the fact that
\[
(3.2) \quad \|C_1\|_{(b^{p}_v,b^{p}_v)} \geq 1.
\]
The inequality (3.1) together with the inequality (3.2) show that
\[
(3.3) \quad \|C_1\|_{(b^{p}_v,b^{p}_v)} = 1.
\]
Thus, (3.3) completes the proof. \(\square\)
Theorem 3.2. \( C_1^* \in B(d_q) \) with the norm \( \|C_1^*\|_{(d_q;d_q)} = 1 \); where \( 1 < q \leq \infty \).

Proof. Since \( d_1 \cong bv_1^* \) and \( d_p \cong bv_p^* \) by Lemma 2.1 and \( \|C_1^*\|_{(d_q;d_q)} = \|C_1\|_{(bv_p;bv_p)} \), this is immediate by Theorem 3.1, where \( 1 < p < \infty \).

Theorem 3.3. \( \sigma(C_1, bv_p) = \{ \alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| \leq \frac{1}{2} \} \).

Proof. To prove the theorem, it is enough to show that \( (C_1 - \alpha I)^{-1} \) is bounded for all \( \alpha \)'s such that \( |\alpha - 1/2| > 1/2 \). Suppose \( y = (y_k) \in bv_p \). Solving the equation \( (C_1 - \alpha I)x = y \) for \( x \) in terms of \( y \), we derive that

\[
\begin{align*}
x_0 &= \frac{1}{1 - \alpha} y_0 \\
x_1 &= -1 \frac{1}{(1 - \alpha)(1 - 2\alpha)} y_0 + \frac{2}{1 - 2\alpha} y_1 \\
x_2 &= -1 \frac{2\alpha}{\prod_{k=1}^{3} 1 - k\alpha} y_0 - \frac{2}{\prod_{k=2}^{3} 1 - k\alpha} y_1 + \frac{3}{1 - 3\alpha} y_2 \\
&\vdots \\
x_n &= \frac{1}{n + 1} \sum_{k=0}^{n-1} (-1)^{n-k} \left( \prod_{j=k+1}^{n+1} \frac{j}{1 - j\alpha} \right) \alpha^{n-k-1} y_k + \frac{n + 1}{1 - (n + 1)\alpha} y_n
\end{align*}
\]

Therefore, we have \( (C_1 - \alpha I)^{-1} = (e_{nk}) \) defined by

\[
e_{nk} = \begin{cases} 
\frac{(-1)^{n-k}}{n+1} \left( \prod_{j=k+1}^{n+1} \frac{j}{1 - j\alpha} \right) \alpha^{n-k-1}, & (0 \leq k \leq n - 1) \\
\frac{k + 1}{1 - (k+1)\alpha}, & (k = n) \\
0, & (k > n)
\end{cases}
\]

Thus, it is seen by [17] that \( \|C_1 - \alpha I\|_{(bv_1;bv_1)} < \infty \), if \( |\alpha - 1/2| > 1/2 \) which is equivalent to the fact that \( Re(1/\alpha) < 1 \).

Furthermore, if \( p > 1 \) then

\[|x_n - x_{n-1}|^p = |x_n - x_{n-1}|^{p-1} \cdot |x_n - x_{n-1}|.\]

We can show that

\[|x_n - x_{n-1}| \to 0; \ (n \to \infty),\]

if \( Re(1/\alpha) < 1 \). Indeed,

\[
x_n - x_{n-1} = \frac{(-1)^n}{n+1} \prod_{k=1}^{n+1} \frac{k}{1 - k\alpha} \alpha^{n-1} y_0 +
\]
\[
\begin{align*}
+ \left[ \frac{(-1)^{n+1}}{n+1} \prod_{k=2}^{n+1} \frac{k}{1-k\alpha} \alpha^{n-2} y_1 - \frac{(-1)^{n-1}}{n} \prod_{k=1}^{n} \frac{k}{1-k\alpha} \alpha^{n-2} y_0 \right] + \\
+ \cdots + \left[ \frac{n+1}{1-(n+1)\alpha} y_n - \frac{n}{1-n\alpha} y_{n-1} \right].
\end{align*}
\]

If we use Lemma 7 in [16, p. 266] with the last relation then we have (3.5). Thus, (3.4) and (3.5) yield that
\[\| (C_1 - \alpha I)^{-1} \|_{(bv_p, bv_p^*)} < \infty,\]
if \(Re(1/\alpha) < 1\). This completes the proof. \(\Box\)

We should remark the reader from now on that the index \(p\) has different meanings in the notation of the sequence spaces \(bv_p, bv_p^*\) and in the point spectrums \(\sigma_p(\Delta, bv_p), \sigma_p(\Delta^*, bv_p^*)\) which occur in the following two theorems.

**Theorem 3.4.** \(\sigma_p(C_1, bv_p) = \{1\}\).

**Proof.** Suppose that \(C_1 x = \alpha x\) for \(x \neq \theta = (0, 0, 0, \ldots)\) in \(bv_p\). Consider the system of the linear equations
\[
\begin{align*}
x_0 &= \alpha x_0 \\
\frac{1}{3} x_0 + \frac{1}{3} x_1 &= \alpha x_1 \\
\frac{1}{k+1} x_0 + \frac{1}{k+1} x_1 + \frac{1}{k+1} x_2 + \cdots + \frac{1}{k+1} x_k &= \alpha x_k
\end{align*}
\]
(3.6)

If \(x_0\) is the non-zero term of the sequence \(x = (x_n)\), then \(\alpha = 1\) and we obtain from (3.6) that \(x_k = x_0\) for any \(k \geq 1\). Hence, \(x = (x_k) \in bv_p\) such that \(x \neq \theta\) for \(p \geq 1\).

If \(x_{n_0}\) is the first non-zero entry of the sequence \(x = (x_n)\), then we find that
\[
\frac{1}{n_0 + 1} x_{n_0} = \alpha x_{n_0},
\]
which yields the fact \(\alpha = 1/(n_0 + 1)\). Therefore, we also get by (3.6) that
\[
x_{n_0+k} = \frac{(n_0 + 1)(n_0 + 2) \cdots (n_0 + k)}{k!} x_{n_0}
\]
for any \(k \geq 1\). Furthermore,
\[
|x_{n_0+k} - x_{n_0+k-1}|_p = \frac{n_0^p(n_0 + 1)^p \cdots (n_0 + k - 1)^p}{(k!)^p} |x_{n_0}|^p
\]
\[ \frac{1}{(n_0 - 1)!^p} p(k + 1)^p(k + 2)^p \cdots (n_0 + k - 1)^p |x_{n_0}|^p, \]

which shows that \( x \notin bv_p \) and this completes the proof. \( \square \)

Prior to giving Theorem 3.6 we shall quote a lemma which is needed in proving.

**Lemma 3.5.** [13, p. 115] All harmonic series \( \sum_n n^{-\alpha} \) for \( \alpha \leq 1 \) are divergent, and for \( \alpha > 1 \), convergent.

**Theorem 3.6.** \( \sigma_p(C_1^*, \ bv_p^*) = \{ \alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| < \frac{1}{2} \} \cup \{1\} \).

**Proof.** Suppose \( C_1^*f = \alpha f \) for \( f \neq \theta \) in \( bv_p^* \). Then, by solving the system of the linear equations

\[
\begin{align*}
&f_0 + \frac{1}{2} f_1 + \frac{1}{3} f_2 + \cdots = \alpha f_0 \\
&\frac{1}{2} f_1 + \frac{1}{3} f_2 + \cdots = \alpha f_1 \\
&\frac{1}{3} f_2 + \cdots = \alpha f_2 \\
&\vdots \\
&\frac{1}{k+1} f_k + \cdots = \alpha f_k
\end{align*}
\]

we obtain that

\[
f_k = \prod_{n=1}^{k} \left( 1 - \frac{1}{n\alpha} \right) f_0, \quad (k = 1, 2, \ldots)
\]

if \( \alpha \neq 0 \). Since \( f = (f_0, 0, 0, \ldots) \neq \theta \) in \( bv_p^* \) for \( \alpha = 1 \), it is clear that \( 1 \in \sigma_p(C_1^*, \ bv_p^*) \). Define the sequence \( z = (z_k) \) by

\[
z_k = \prod_{n=1}^{k} \left( 1 - \frac{1}{n\alpha} \right), \quad (k = 1, 2, \ldots).
\]

Okutoyi [15, Lemma 1.4] has proved that

\[
z_k = A \cdot k^{-1/\alpha} + O \left( k^{-Re(1/\alpha) - 1} \right),
\]

where \( A \) is a constant and the series \( \sum z_k \) is bounded if \( Re(1/\alpha) > 1 \), diverges if \( Re(1/\alpha) \leq 1 \). Consider the sequence \( s = (s_k) \) defined by

\[
s_k = \sum_{j=k}^{\infty} \frac{1}{j^{1/\alpha}}, \quad (k \in \mathbb{N}).
\]

It is known that \( |s_k| < \infty \) if and only if \( Re(1/\alpha) > 1 \). Denote \( Re(1/\alpha) = \beta \) and let \( \beta > 1 \). Therefore, using the fact given by Lemma 3.5 for the
convergence of the series

\[ s_1 = \sum_{j=1}^{\infty} \frac{1}{j^\beta} \]

we obtain that

\[ s_k \leq \left[ \frac{1}{2(m-1)\beta} + \cdots + \frac{1}{(2m - 1)\beta} \right] + \frac{1}{2m\beta} + \cdots + \frac{1}{(2m+1 - 1)\beta} + \cdots, \]

where \(2^{m-1} \leq k \leq 2^m - 1\). Now, replacing any separate term by the first term in each parenthesis in (3.7) we get that

\[ s_j \leq \frac{2^{\beta-1}}{2^{\beta-1} - 1} \cdot \frac{1}{2(m-1)(\beta-1)}. \]  

It is clear by (3.8) that

\[ \left| \sum_{j=k}^{\infty} \frac{1}{j^{1/\alpha}} \right| \leq \frac{2^{\beta-1}}{2(m-1)(\beta-1) (2^{\beta-1} - 1)}, \quad (k \in \mathbb{N}), \]

if \(\text{Re}(1/\alpha) > 1\). Similarly, one can show that

\[ \left| \sum_{j=k}^{\infty} j^{-\text{Re}(1/\alpha)-1} \right| \leq B \cdot \frac{1}{2(m-1)(\beta-1)}, \quad (k \in \mathbb{N}), \]

where \(B\) is a positive constant. It follows from (3.9) and (3.10) that

\[ \sup_{k,n \in \mathbb{N}} \left| \sum_{j=k}^{n} f_j \right| < \infty. \]

If \(f_0 \neq 0\) and \(\text{Re}(1/\alpha) > 1\), then \(f \in bv_1^\alpha\) and \(f \neq \theta\) whenever \(f_0 \neq 0\).

It is clear that

\[ \left\{ \alpha \in \mathbb{C} : \text{Re} \left( \frac{1}{\alpha} \right) > 1 \right\} = \left\{ \alpha \in \mathbb{C} : \left| \alpha - \frac{1}{2} \right| < \frac{1}{2} \right\}. \]

Now, using (3.9) and (3.10) we obtain that

\[ \left| \sum_{j=k}^{n} f_j \right|^q \leq M \cdot \frac{1}{2(m-1)(\beta-1)q}. \]
where $M$ is a positive constant. Consequently, we derive from (3.12) that

$$\sum_{k}^{\infty} \left| \sum_{j=k}^{\infty} f_j \right|^q < \infty.$$ 

This means that $(f_k) \in bv_\alpha$ and (3.11) together with (3.12) complete the proof. \hfill \square

Now, we may give the following lemma requiring in the proof of next theorem:

**Lemma 3.7.** [9, p. 59] A linear operator $T$ has a dense range if and only if the adjoint $T^*$ of $T$ is one to one.

**Theorem 3.8.** $\sigma_c(C_1, bv_p) = \{ \alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| = \frac{1}{2}, \alpha \neq 1 \}$.

**Proof.** It is not hard to show that

$$\left\{ \alpha \in \mathbb{C} : \left| \alpha - \frac{1}{2} \right| = \frac{1}{2} \right\} = \left\{ \alpha \in \mathbb{C} : \text{Re} \left( \frac{1}{\alpha} \right) = 1 \right\} \cup \{0\}.$$ 

Suppose that $\alpha \neq 1$. Then, it follows by Theorem 3.6 that $\alpha \notin \sigma_p(C_1^*, bv_p^*)$. Hence, $Ker(C_1^* - \alpha I^*) = \{ \theta \}$ for such $\alpha$’s which shows that

(3.13) 

$$\overline{R}(C_1^* - \alpha I) = bv_p.$$ 

Now, suppose that $\alpha = 0$ and consider the equation

$$C_1x = \theta.$$ 

Then, it is easy to see that $x = \theta$, i.e., $Ker(C_1) = \{ \theta \}$ and $C_1$ has an inverse. One can also see that $Ker(C_1^*) = \{ \theta \}$ and we thus have

(3.14) 

$$\overline{R}(C_1) = bv_p.$$ 

Therefore, we obtain by combining (3.13), (3.14) and Lemma 3.7 that

$$\sigma_c(C_1, bv_p) = \{ 0 \} \cup \left\{ \alpha \in \mathbb{C} : \text{Re} \left( \frac{1}{\alpha} \right) = 1, \alpha \neq 1 \right\},$$ 

which completes the proof. \hfill \square

**Theorem 3.9.** $\sigma_r(C_1, bv_p) = \{ \alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| < \frac{1}{2} \}$.

**Proof.** This immediately follows from Theorems 3.3, 3.4 and 3.8, by taking into account the definition of the concept of the spectrum of a bounded linear operator acting in a Banach space. \hfill \square

Combining Theorems 3.1, 3.3, 3.4 and Theorems 3.8, 3.9; we have the following main theorem:
Theorem 3.10. (a) $C_1 \in B(bv_p)$ with the norm $\|C_1\|_{(bv_p; bv_p)} = 1$,

(b) $\sigma(C_1, bv_p) = \{\alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| \leq \frac{1}{2}\}$,

(c) $\sigma_p(C_1, bv_p) = \{1\}$,

(d) $\sigma_c(C_1, bv_p) = \{\alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| = \frac{1}{2}, \alpha \neq 1\}$,

(e) $\sigma_r(C_1, bv_p) = \{\alpha \in \mathbb{C} : |\alpha - \frac{1}{2}| < \frac{1}{2}\}$.

Acknowledgement

The second author wishes to express his thanks to Prof. Dr. E. Savaş, Yüzüncü Yıl Üniversitesi, Eğitim Fakültesi, Van-65080/Türkiye, for supplying the paper [10]. We should also record our gratitude to Prof. Dr. Bilal Altay, İnönü Üniversitesi, Eğitim Fakültesi, Matematik Eğitimi Bölümü, 44280-Malatya/Türkiye, for his kindly helps during the revising of the work. Finally, we thank to the reviewer for his/her careful reading and making some useful comments which improved the presentation of the paper.
